**200,000 CLIMATE SERVICE STATIONS PRODUCED: CELEBRATION AT TEXA'S PLANT**

**A new major milestone for the company and its employees, confirming the quality of the KONFORT 700 range, sold and appreciated by mechanics all over the world.**

It's a day of celebration at TEXA: the company has reached the milestone of **200,000 KONFORT Series 700 stations produced since 2011**. This is an exceptional achievement in the garage equipment industry for **a product line dedicated to vehicle air conditioning maintenance and recharging**. Over the years, the KONFORT 700 line has become a global benchmark for robustness, efficiency, and reliability—qualities that have earned approval and recommendation from the **world's leading vehicle manufacturers**. Today, the range includes 12 models and is divided into KONFORT and KONFORT TOUCH, depending on the type of display—either a standard keypad or a 7- or 10-inch touchscreen. The models work with the main refrigerant gases currently in use—R134a, R444a, R456a, R1234yf, and R744—and stand out for their **advanced user interface**, which allows **for even simpler and faster interaction**.

"The 200,000 KONFORT 700 units produced represent a great achievement," said **Bruno Vianello, President of TEXA**, "which confirms our commitment and drive to innovate in the world of workshop equipment. It is also thanks to the success of these products that we decided to invest in a **new facility of over 30,000 square meters**, currently being built right next to our headquarters. It will also host the production of e-Fluid, another advanced solution for the maintenance of electric vehicle cooling systems, which we are currently manufacturing exclusively for the **Volkswagen Group**."

The expansion of TEXA's main headquarters follows the inauguration, in September 2023, of the **e-Powertrain plant**, also in Monastier di Treviso: more than **24,000 square meters** dedicated to the production of sophisticated inverters, vehicle control units, and axial flux electric motors, which have been successfully applied in high-performance vehicles by **Lamborghini** and other prestigious car manufacturers protected by industrial secrecy.

The continued global success of TEXA's products suggests a projected turnover for the current year exceeding **200 million euros**, with over 70% coming from exports.
